

## BENZO[1,2,5]THIADIAZOLE COMPOUNDS

### Field of the Invention

There is provided by the present invention compounds that are CCK2  
5 receptor modulators. More particularly, there is provided by the present  
invention benzo[1,2,5]thiadiazoles that are CCK2 receptor modulators useful  
for the treatment of disease states mediated by CCK2 receptor activity.

### Background of the Invention

10 This invention relates to gastrin and cholecystokinin (CCK) receptor  
ligands. The invention also relates to methods for preparing such ligands and  
to compounds that are useful intermediates in such methods. The invention  
further relates to pharmaceutical compositions comprising such ligands and  
methods for preparing such pharmaceutical compositions.

15 The gastrins and cholecystokinins are structurally related neuropeptides  
that exist in gastrointestinal tissue, gastrinomas and, in the case of the  
cholecystokinins, the central nervous system (J.H. Walsh, Gastrointestinal  
Hormones, L.R. Johnson, ed., Raven Press, New York, 1994, p. 1).

Several forms of gastrin are found including 34-, 17- and 14-amino acid  
20 species with the minimum active fragment being the C-terminal tetrapeptide  
(TrpMetAspPhe-NH<sub>2</sub>), which is reported in the literature to have full  
pharmacological activity (H.J. Tracy and R.A. Gregory, Nature (London), 1964,  
204:935-938). Much effort has been devoted to the synthesis of analogs of this  
tetrapeptide (and the N-protected derivative Boc-TrpMetAspPhe-NH<sub>2</sub>) in an  
25 attempt to elucidate the relationship between structure and activity.

Natural cholecystokinin is a 33 amino acid peptide (CCK-33), the C-  
terminal 5 amino acids of which are identical to those of gastrin. Also found  
naturally is the C-terminal octapeptide (CCK-8) of CCK-33. A review of CCK  
receptors, ligands and the activities thereof may be found in P. de Tullio et al.  
30 (Exp. Opin. Invest. Drugs, 2000, 9(1):129-146).

Gastrin and cholecystokinin are key regulators of gastrointestinal  
function. In addition, cholecystokinin is a neurotransmitter in the brain. Gastrin  
is one of the three primary stimulants of gastric acid secretion. In addition to

the acute stimulation of gastric acid, gastrin has a trophic effect on the gastrointestinal mucosa and is implicated as a trophic hormone of several adenocarcinomas, including pancreatic, colorectal, esophageal and small cell lung.

5           Cholecystokinin stimulates intestinal motility, gallbladder contraction and pancreatic enzyme secretion, and is known to have trophic actions on the pancreas thus increasing, inter alia, pancreatic enzyme production.

Cholecystokinin also inhibits gastric emptying and has various effects in the central nervous system, including regulation of appetite and pain.

10           Gastrin acts on CCK2 (otherwise known as gastrin/CCK-B receptors) whereas cholecystokinin acts on both CCK2 and CCK1 receptors (otherwise known as cholecystokinin/CCK-A receptors). Compounds that bind to cholecystokinin and/or gastrin receptors are important because of their potential pharmaceutical use as antagonists of the natural peptides or mimetics.

15           of the natural peptides acting as partial or full agonists at the cholecystokinin and/or gastrin receptors. A selective gastrin receptor antagonist has not yet been marketed. However, several are currently undergoing clinical evaluation. JB95008 (gastrazole) is being developed by The James Black Foundation and Johnson & Johnson Pharmaceutical Research and Development LLC for the

20           potential treatment of advanced pancreatic cancer (pancreatic adenocarcinoma), and is currently in Phase II clinical trials. ML Laboratories and Panos are developing L-365,260 (Colycade), which is in Phase II clinical trials for pain. Other potential indications included eating disorders and cancer. YF-476 (formerly YM-220), under joint development by Yamanouchi and

25           Ferring Research Institute, is in Phase I clinical trials for gastro-esophageal reflux disease (GERD). In Phase I trials, Zeria Pharmaceutical is investigating Z-360, an orally available 1,5-benzodiazepine derivative (WO-09825911), as a potential treatment for gastroduodenal ulcers and reflux esophagitis. CR 2945 (itriglumide), an orally active anthranilic acid derivative, has been investigated

30           by Rotta in Phase I trials for anxiety disorders, cancer (particularly colon cancer) and peptic ulcer.

Gastrimmune, Aphton Corporation's anti-gastrin vaccine, which works by chemical neutralization of the hormone, is undergoing late stage clinical trials for cancer indications, in particular, pancreatic and gastric tumors.

In addition to those indications described above, gastrin (CCK2) antagonists have been proposed for the following gastrin-related disorders: gastrointestinal ulcers, Barrett's esophagus, antral G cell hyperplasia, pernicious anaemia, Zollinger-Ellison syndrome and other conditions in which lower gastrin activity or lower acid secretion is desirable.

Cholecystokinin (CCK1) receptors have been shown to mediate cholecystokinin-stimulated gallbladder contraction, pancreatic enzyme secretion, satiety, gastric emptying inhibition and regulation of peristalsis, indicating a key role in the integrated physiological gastrointestinal response to a meal. In addition, there is evidence that cholecystokinin receptors mediate a mitogenic action of cholecystokinin on some adenocarcinomas. Consequently, selective cholecystokinin receptor antagonists, for example, devazepide (Merck), lorglumide (Rotta), 2-NAP (JBF), dexloxiglumide (Rotta) and lintitript (Sanofi) have been examined in the clinic for potential applications in, inter alia, irritable bowel syndrome, chronic constipation, non-ulcer dyspepsia, acute and chronic pancreatitis, biliary disease and pancreatic cancer. Additional roles of cholecystokinin receptors include the regulation of appetite and metabolism, indicating potential therapeutic applications in the treatment of disorders such as obesity and anorexia nervosa. Other possible uses are in the potentiation of opiate (for example, morphine) analgesia and in the treatment of cancers, especially of the pancreas. Moreover, ligands for cholecystokinin/gastrin receptors in the brain have been claimed to possess anxiolytic activity, and gastrin receptor antagonists would be expected to act as neurological agents towards the relief of anxiety and related neuroses and psychoses.

More specifically, the invention may not include compounds in which:

A) one or both of R<sup>1</sup> and R<sup>2</sup> is phenyl substituted with 0, 1, 2, or 3 of halo, or

B) R<sup>1</sup> and R<sup>2</sup> taken together with the nitrogen to which they are attached is a 4-7 membered heterocyclic ring said heterocyclic ring having 0 or 1 additional heteroatom members separated from the nitrogen of attachment by at least one carbon member and selected from O and having 0, 1 or 2 substituents R<sup>p</sup> and R<sup>a</sup> is nonexistent or there is a single R<sup>a</sup> at the meta position of benzamide.

The features and advantages of the invention are apparent to

one of ordinary skill in the art. Based on this disclosure, including the summary, detailed description, background, examples, and claims, one of ordinary skill in the art will be able to make modifications and adaptations to various conditions and usages. Publications described herein are incorporated by reference in their entirety.

Compounds of the present invention may be produced according to two broadly described reaction schemes. In Scheme A, sulfonylation is the final step of the process and in Scheme B, sulfonylation is the initial step of the process. Persons skilled in the art will recognize that certain compounds are more advantageously produced by one scheme as compared to the other.

Scheme A

Referring to Scheme A, commercially available aminonaphthoic acid A1 is reacted with triphosgene and Hünig's base to produce the benzofused isatoic anhydride species of the genus A2. Various isatoic anhydrides A2 are available commercially. An amine is acylated with the isatoic anhydride A2 to produce a benzamide A5. Benzamide A5 may also be obtained from commercially available anthranilic acid A3 through peptide coupling. Benzamide A5 may additionally be obtained from commercially available nitrobenzoic acid A4 through peptide coupling followed by reduction of the nitro group. Benzamide A5 is sulfonylated with the sulfonyl chloride to produce active compounds A6. Where R<sup>a</sup> or R<sup>b</sup> is a primary or secondary amine or hydroxy, they can be protected with common protecting groups. In the case of the primary or secondary amine, there can be employed Boc or Cbz. In the case of hydroxy, there can be employed TBS, TES or benzyl. Of course, a precursor substituent may be employed in the reaction steps and later transformed into the desired substituent. For example, where A6 is produced with R<sup>a</sup> as nitro, the nitro may be reduced to the amine, and the amine may be, for example, alkylated, acylated, diazotized, etc.

Scheme B

- 5 Referring to Scheme B, methyl anthranilate B1 is sulfonylated to sulfonamide B2. The methyl ester is hydrolyzed to the acid B3. Acid B3 undergoes peptide coupling under standard conditions with an amine to produce active compounds B4. Where  $R^a$  or  $R^b$  is a primary or secondary amine or hydroxy, it can be protected with common protecting groups. In the
- 10 case of the primary or secondary amine, there can be employed Boc or Cbz. In the case of hydroxy, there can be employed TBS, TES or benzyl. Of course, a precursor substituent may be employed in the reaction steps and later transformed into the desired substituent. For example, where B4 is produced with  $R^a$  as nitro, the nitro may be reduced to the amine and the amine may be,
- 15 for example, alkylated, acylated, diazotized, etc.

Effective doses of the compounds of the present invention may be ascertained by conventional methods. The specific dosage level required for

any particular patient will depend on a number of factors, including severity of the condition being treated, the route of administration and the weight of the patient. In general, however, it is anticipated that the daily dose (whether administered as a single dose or as divided doses) will be in the range 0.01 to 1000 mg per day, more usually from 1 to 500 mg per day, and most usually from 10 to 200 mg per day. Expressed as dosage per unit body weight, a typical dose will be expected to be between 0.0001 mg/kg and 15 mg/kg, especially between 0.01 mg/kg and 7 mg/kg, and most especially between 0.15 mg/kg and 2.5 mg/kg.

A. 1-Bromo-4,5-dichloro-2-nitro-benzene. 4-Bromo-1,2-dichlorobenzene (10.5 g, 46.3 mmol) was added to 25 mL concentrated sulfuric acid at  $0^\circ\text{C}$ . A 1:1 mixture of 70% nitric acid and concentrated sulfuric acid (20 mL) was added dropwise over 40 min. The reaction mixture was allowed to warm to ambient temperature with stirring over 0.5 h, then was poured onto cracked ice. Recrystallization from absolute ethanol provided 4.76 g of long yellow needles corresponding to a 20:1 mixture of product to starting material. The mother liquor was concentrated and recrystallized twice to provide an additional 1.18 g of product (17:1 mixture with recovered starting material).

TLC (silica gel, 1:1 hexanes/EtOAc):  $R_f$  = 0.45.  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ): 7.95 (s, 1H), 7.80 (s, 1H).

### Assay Methods

#### Binding Assay

##### Assay development

- Zinc Finger Proteins (ZFP) specific for the CCK2R gene were identified by Sangamo Biosciences. The ZFP domain was fused with the herpes simplex virus VP16 activation domain, and the fusion protein was subsequently cloned into the pcDNA3 mammalian expression vector (Invitrogen, San Diego, CA). Tet-inducible cell lines expressing the coding region from the ZFP vector were
- 20

created using the T-REx-293<sup>TM</sup> cell line (Invitrogen). After 2 weeks of selection in culture medium containing 400 mg/mL Zeocin (Invitrogen), sixty drug-resistant stable clones were isolated and analyzed for ZFP expression as well as CCK2R induction upon addition of doxycycline to the culture medium. The cell line with the most appropriate CCK2R ZFP construct was used in all further assays and was termed the HEKZFP cell line.

#### Cell culture

HEKZFP cells were grown in DMEM supplemented with L-glutamine (2 mM), penicillin (50 units/mL) and streptomycin (50 µg/mL) and 10% FBS (v/v). HEKZFP cells were treated with 2mM doxycycline (Sigma-Aldrich, MO; USA) for 2 days to de-repress the tet-regulated expression of the CCK2 receptor selective zinc finger proteins and were harvested using a rubber cell scraper.

#### Membrane Preparation

Membranes were prepared from the HEKZFP cells after induction. Frozen cell pellets (−40 °C) were thawed in 14 mL of buffer A (10 mM HEPES, 130 mM NaCl, 4.7 mM KCl, 5 mM MgCl, 1 mM EGTA and 15.4 mg/100mL bacitracin at pH 7.2), adapted from E. A. Harper et al. (Br. J. Pharmacol. (1996) 118(7):1717–1726). The thawed pellets were homogenized using a Polytron PT-10 (7 X 1 s). The homogenates were centrifuged for 5 min at 1500 rpm (600 X g), and the resulting pellets were discarded. The supernatants were re-centrifuged in order to collect the receptor-membrane pellets (25 min 15,000 rpm; 39,800 X g), which were re-suspended in buffer A.

25

#### Incubation Conditions

All assays were conducted in 96-well plates (GF/B millipore filter plates) using buffer A. For the optimal cell number determination experiments, cells in concentrations ranging from  $2.5 \times 10^5$  to  $12.5 \times 10^5$  cells/well were incubated with 20 pM [<sup>125</sup>I]-BH-CCK-8S (50 µL 60 pM solution) in a total volume of 150 µL. Total binding of [<sup>125</sup>I]-BH-CCK-8S was determined in the presence of 15 µL of buffer A. Non-specific binding of [<sup>125</sup>I]-BH-CCK-8S was determined in the presence of 15 µL of 10 µM YF476, a CCK-2 receptor selective antagonist that

is structurally unrelated to the radioligand [<sup>125</sup>I]-BH-CCK-8S. The assay preparation was incubated for 1 h at 21±3 °C, and then the assay was terminated by rapid filtration of the preparation under reduced pressure. The loaded filters were washed three times using undiluted PBS (100 µL), and then 5 100 µL of scintillation fluid was added to the filter plate. Bound radioactivity was determined using a Topcount (Packard BioScience, Meriden, CT) with a count time of 1 min. From these experiments a cell concentration of 1 pellet in 15 mL of buffer was chosen for use in other assays. To validate the radioligand concentration and incubation time for the assay, saturation and 10 kinetic binding studies were also conducted (see M.F. Morton, The Pharmacological Characterization of Cholecystokinin Receptors in the Human Gastrointestinal Tract. PhD Thesis, University of London, 2000). The affinity of novel compounds was estimated by incubating membrane preparations with 15 µL of competing ligand (0.1 pM–1 mM) for 60 min at 21±3 °C. The assay 15 was then terminated according to the procedure outlined above.

#### Data Analysis

The pK<sub>i</sub> values were determined using the equation of Y.-C. Cheng and W. H. Prusoff (Biochem. Pharmacol., 1973, 22(23):3099–3108):

$$K_i = \frac{IC_{50}}{1 + \frac{[L]}{K_D}}$$

To circumvent problems associated with computer-assisted data analysis of compounds with low affinity, the data obtained in the current study were weighted according to a method described by Morton. In brief, 100% and 0% specific binding were defined independently using total binding and binding 25 obtained in the presence of a high concentration of the reference antagonist, 2-NAP.

#### Guinea-pig Gastric Corpeal Muscle Assay

- 5 CCK2 receptor-mediated muscle contraction was measured in an isolated muscle-strip assay of guinea-pig gastric corpeal muscle according to the methods described by Roberts et al. (S.P. Roberts, E.A. Harper, G.F. Watt, V.P. Gerskowitch, R.A. Hull, N.P. Shankley, and J.W. Black, Br. J. Pharmacol., 1996, 118(7):1779–1789). In brief, strips of muscle were dissected and
- 10 suspended in isolated tissue organ baths for isotonic muscle contraction recording. The baths, containing Krebs-Henseleit solution, were maintained at 24 °C and gassed continuously with 95% O<sub>2</sub> and 5% CO<sub>2</sub>. CCK1 receptors known to be present in this assay were blocked using a selective concentration of a suitable CCK1 receptor antagonist (e.g. 2-NAP). The effectiveness of the
- 15 test compounds was assessed by measuring their effect on contractile concentration-response curves obtained using a well-characterized surrogate for the hormone gastrin (pentagastrin). The title compound of Example 5 behaved as a competitive antagonist in this assay with a pK<sub>B</sub> value of 8.8.
